NON-CUSTODIAL · BUILT ON STELLAR

Your wallet, hidden in plain sight.

A non-custodial Stellar wallet whose encrypted key lives inside an image. No seed phrase to lose.

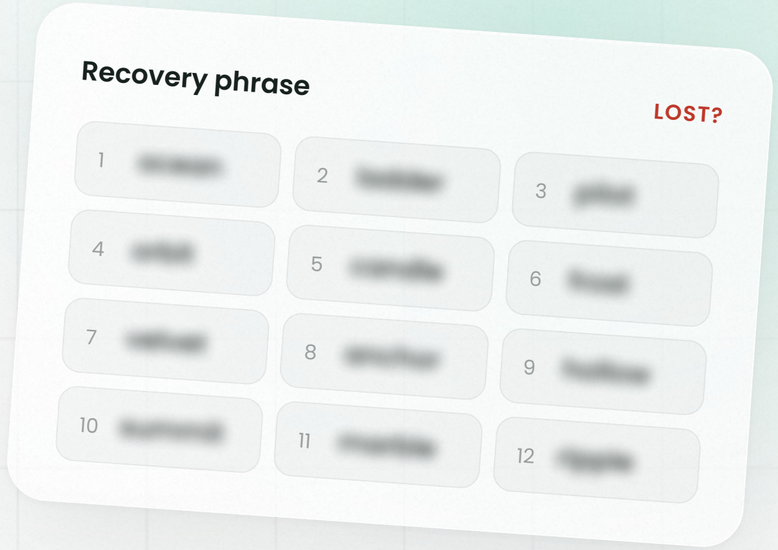

- AES-256-GCM
- Argon2id
- SEP-0005

Your key. Your image. Your password.

THE PROBLEM

Self-custody breaks at the backup.

People don't lose crypto to clever attacks. They lose it to a paper slip in a drawer.

01

Backups fail quietly

Seed phrases get photographed, misplaced, damaged or simply forgotten. You only find out on the day you need it.

02

Convenience defeats security

The safe option is awkward, so people reach for the easy one: screenshots, notes apps, cloud docs.

03

So users choose custody

Handing keys to an exchange feels safer than guarding twelve words. That trades away the point of owning crypto.

WHO IT HURTS

Seed phrases fail quietly.

That fear pushes people back to custodians.

01 **Everyday holders**

Guarding twelve words feels harder than trusting an exchange.

02 **Convenience-first users**

Keep their seed in a screenshot, a notes app or a cloud doc.

03 **Self-custody itself**

Pushed back to custody, losing the point of owning crypto.

THE SOLUTION

Your image is your wallet.

HideW encrypts your Stellar key and tucks it inside an ordinary PNG. No seed phrase on paper, no custodian holding your funds. Just your image and your password.

12
recovery words you never see

~5s
Stellar settlement

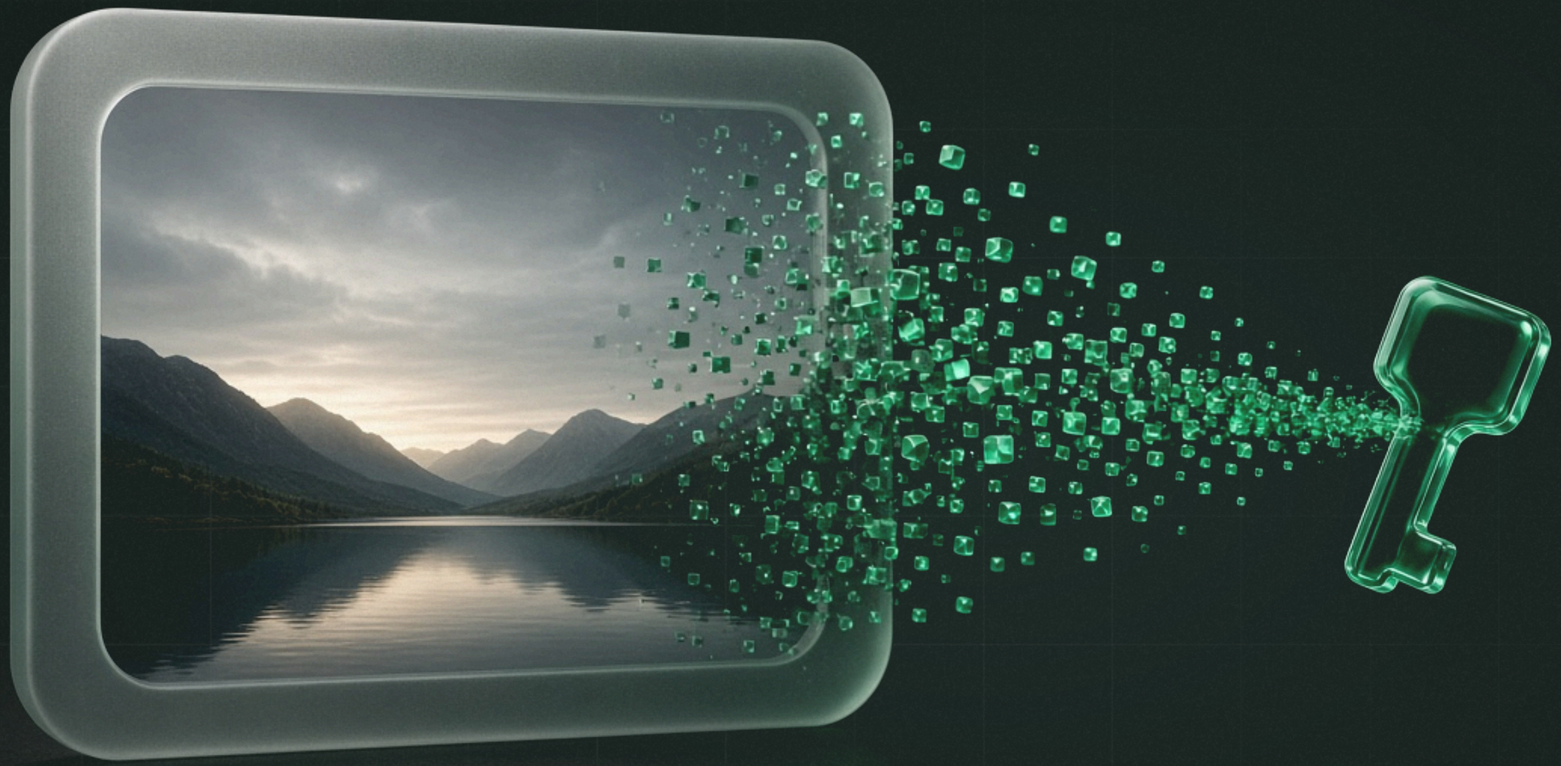

0
copies of your key we hold

Your key. Your image. Your password.

EXPLAINER

How an image becomes your wallet.

Fifteen seconds, five steps. From a photo you like to a wallet only you can open.

1 **A normal photo**

Any picture you like

2 **Derive a key**

Argon2id stretches your password

3 **Encrypt**

AES-256-GCM seals the wallet key

4 **Hide in pixels**

Ciphertext in the pixel bits

5 **Unlock & pay**

Signed in your browser

HOW IT WORKS

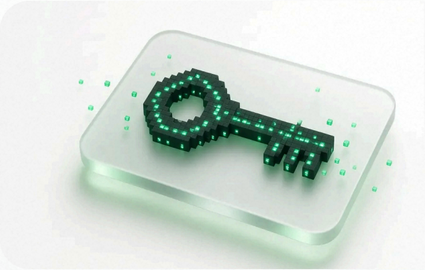

Four steps. One image. Only you can open it.

01

Pick any PNG

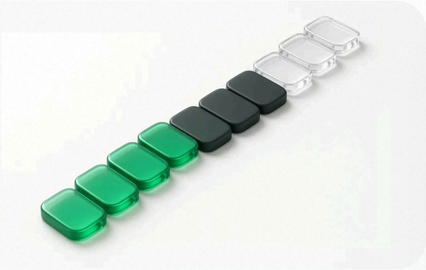

A holiday photo, a pet, a sunset. Any image becomes the carrier for your wallet.

02

Derive and encrypt

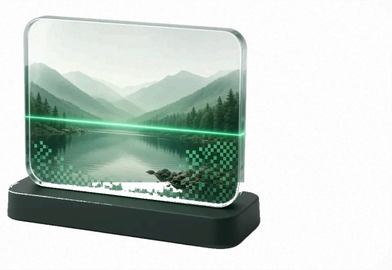

A BIP-39 mnemonic derives your Stellar key via SEP-0005, then AES-256-GCM seals it on your device.

03

Hide it in the pixels

The ciphertext is spread across the image in a key-derived pixel order. It still looks like a picture.

04

You hold the only copy

Without your password the wrapped key is useless. We never see it, store it or hold a spare.

SECURITY MODEL

Serious cryptography, zero escrow.

Your password is stretched with memory-hard Argon2id into a key that wraps your wallet key. The secret never leaves your device.

hidew · keyspec

kdf	Argon2id · 384 MB · t=3
cipher	AES-256-GCM
derivation	SEP-0005 · m/44'/148'/0'
signing	client-side · unsigned XDR
key_escrow	none

0 copies of your key we hold

- Argon2id parity
- Pixel permutation
- SEP-0005 test vector
- Fails closed

BUILT ON STELLAR

Built for money that actually moves.

~5s

settlement, with fees measured in fractions of a cent.

Stellar is a network designed for payments, so HideW is too.

- Horizon
- SEP-0005
- SEP-6
- SEP-24
- USDC
- SDEX
- Path payments
- Testnet + Mainnet

PRODUCT

Working today.

Create, recover and pay from one image and one password. Live today:

- Wallet creation, embedded in your PNG
- Recovery with image + password
- Send XLM, signed on-device
- Balance & history from Horizon
- Browser-side signing

USE CASES

One image-backed wallet. Every way money moves.

LIVE

Payments & remittances

Send XLM anywhere with near-instant settlement and negligible fees.

PLANNED

Stablecoin settlement

Trustlines and USDC, held and sent from the same image-backed wallet.

PLANNED

SDEX & path payments

Route payments across Stellar's built-in exchange so the recipient gets the asset they want.

PLANNED

Anchors & on/off ramps

Move between fiat and crypto through SEP-6 and SEP-24 anchors.

BUSINESS MODEL

Built to earn trust, not to hold keys.

HideW is non-custodial: it never holds your funds or your key. The commercial model is still to be set by the team.

01

Revenue model

How HideW earns: fees, premium features or partner revenue.

ROADMAP

Working today. Bigger tomorrow.

LIVE TODAY

- **Wallet creation**
  Key generated, encrypted and embedded in your PNG
- **Recovery**
  Image + password unlocks the account
- **Send XLM**
  Reviewed, signed on-device, then submitted
- **Balance & history**
  Pulled live from Horizon
- **Browser-side signing**
  Argon2id, AES-GCM, steganography, SEP-0005
- **Unfunded accounts**
  createAccount vs payment, 1 XLM minimum handled

NEXT

- **Security audit**
  Third-party review of the crypto and steganography layers
- **USDC**
  Trustlines and USDC support
- **Path payments**
  Routed over SDEX
- **SEP-24 anchors**
  Fiat on/off ramps
- **Fully local recovery**
  Your password is never posted anywhere
- **Mobile app**
  Wrapping the same client-side crypto

VISION

Own your keys. Lose the paperwork.

Lower the self-custody barrier by making the backup something people already keep safe and copy everywhere: a picture.

THE ASK

Let's talk.

We're asking for a technical review of the custody model, and a conversation about which parts of Stellar come next: anchors, SDEX and issued assets.
